What are the Centers for Medicare and Medicaid Services? (CMS)

"CMS is the United States federal agency that provides health coverage to more than **160 million** people through **Medicare, Medicaid**, the **Children's Health Insurance Program**, and the **Health Insurance Marketplace**."

What is an Open Source Program Office? (OSPO)

An OSPO is responsible for defining and implementing programs, policies, and projects that guide inbound and outbound open source efforts at an organization.

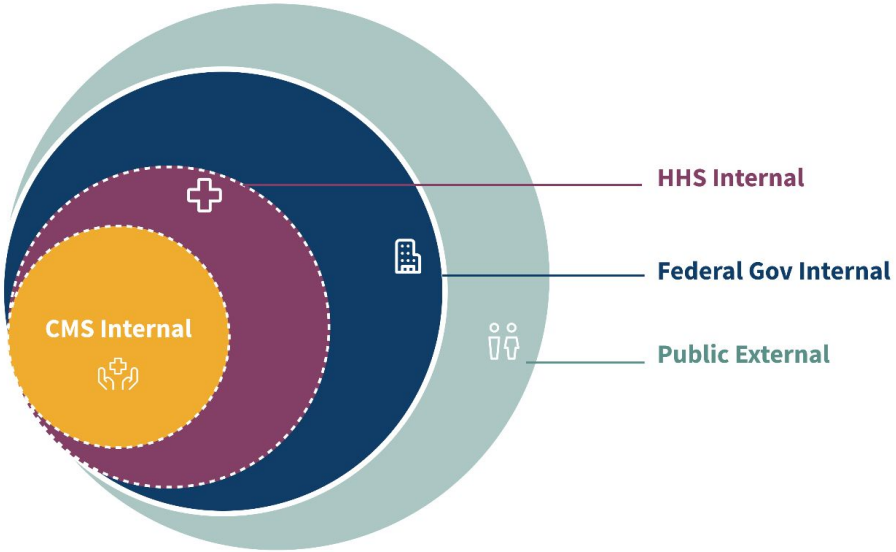

30% of Fortune 100 companies have implemented an OSPO, and CMS is the ***first*** United States federal agency to implement this private-sector styled approach to an Open Source Strategy.

What determines AI Governance in the Federal Ecosystem?

AI governance in the public sector is set by overlapping concentric layers of policies, regulations, memorandums, and laws.

Our Federal Government has Memos from the White House and Laws from Congress to follow for all Departments.

Our home Department (HHS) has policies to follow for all Operational Divisions (OpDivs).

Our Center (Medicare and Medicaid Services) has policies to follow for all offices and programs.

Our Open Source Program Office (OSPO) draws upon these policies, plus open source best practices from the external community, to harmonize our overall guidance.

Federal & Agency-wide Policy Grid

Policy	Level	Description
America's AI Action Plan	Federal	Executive Order 14179, “Removing Barriers to American Leadership in Artificial Intelligence”, directing the creation of an AI Action Plan
Memorandum M-25-21	Federal	Accelerating Federal Use of AI through Innovation, Governance, and Public Trust, establishes an AI Use Case inventory compiling all AI software projects across federal agencies
Memorandum M-25-22	Federal	Driving Efficient Acquisition of Artificial Intelligence in Government
HHS AI Strategy	Agency/HHS	HHS is leading a whole-of-department transformation to make AI a practical layer of value across public health, health care delivery, biomedical research, human services, and agency operations — uniting Divisions through a “OneHHS” approach that shares data, tools, and infrastructure while protecting Americans’ privacy and earning public trust
HHS M-25-21 Compliance Plan	Agency/HHS	HHS created a Compliance Plan mirroring the pillars of the memos: driving AI innovation, improving AI governance and fostering public trust in federal use of AI

CMS Policy Grid

Policy	Level	Description
CMS AI Playbook	OpDiv/CMS	The CMS AI Playbook documents the agency's evolving approach to AI adoption and maturity, offering CMS-specific guidance, tools, and frameworks for leadership, project teams, and IT and security professionals.
CMS Technical Architecture Reference	OpDiv/CMS	The TRA contains guidelines and recommended practices on AI-assisted development in the Software Development Lifecycle: • AI Code Generation • AI Principles for Developers ○ AI Code Generation Accountability ○ Tool Selection and Data Privacy Considerations • AI Development Methodologies ○ "Vibe Coding" Policy Restrictions ○ Suitable Approaches to AI-Assisted Development ○ AI in the SDLC — Shifting Left: Integrating Quality and Security • Examples of AI Benefits in the Software Development Lifecycle

Which AI-related risks are most connected to our OSPO's work?

Risk	Mitigation	Resources
Excess of low quality or extractive contributions/PRs to our open source projects	Contribution Guides and Guardrails	- OSPO GenAI Policy (DRAFT) - CONTRIBUTING.md AI Usage Guidelines
AI-enabled cyber attacks to our software supply chain and systems	Inbound and Outbound review checklists; Automated vulnerability scanning and remediation	- Inbound Checklists - Outbound Checklists via repo-scaffolder - Code Analysis Toolkit
Unwise or excessive usage of CMS resources	A plurality of HHS and CMS hosted tools and Models	- AI @ CMS Guide
Leakage of sensitive and personal data	Outbound Review Checklists and Automated Scanning tools	- Outbound Checklists via repo-scaffolder - Code Analysis Toolkit

CMS OSPO GenAI Contribution Policy (DRAFT)

https://dsacms.github.io/ospo-guide/outbound/gen-ai-policy
https://github.com/DSACMS/ospo-guide (patches welcome!)

GenAI Contribution Guidelines and Guardrails

- **Extractive Contributions** are when the effort put in does not meet or exceed the effort it takes to review.
- Guidelines and Disclosures turn reviews from a high-effort one-off evaluations into a checklist. Checklists are made for Humans. They create structured spaces for intentional, repeatable participation that reduce cognitive and actual burden and effort.
- Templates for responding to extractive contributions can be copy-pasted and automated to encourage contributions that follow the guidelines, without the maintainers needing to custom-respond to every PR.
- It's not humans versus machines, **it's clarity v.s. Ambiguity.**

DIGITAL SERVICE AT CMS

Explore the guide: https://dsacms.github.io/ospo-guide/outbound/gen-ai-policy/#reducing-the-risk-of-extractive-contributions

Guideline: Transparency and Disclosure

If AI is used in your work, explicitly state **where** and **how** it was used in your pull request.

- **Acceptable**: Using AI to gain understanding of existing code or to brainstorm solution ideas for an issue.
- **Acceptable**: Using AI to translate or proofread your comments or PR descriptions, while maintaining your original thought and reasoning.

Guideline: Human in the Loop

Using AI does not change who's responsible for the code you submit. A person remains accountable for every one of their contributions, and AI does not act on the project's behalf unsupervised.

- **Not Recommended:** Using external AI tooling *(bots, agents)* to directly interact with the project, including creating issues, opening PRs, or commenting on GitHub.

https://dsacms.github.io/ospo-guide/outbound/gen-ai-policy/#human-in-the-loop

Guideline: Responsible Development and Code Quality

Using AI does should not lower the quality of your code contributions.

- **Unacceptable**: Submitting AI generated code you can't explain line by line to a developer, or using AI output without fully understanding it or verifying it's the correct approach
- **Unacceptable**: Using AI to increase the breadth of your contributions, such as spreading yourself across several projects at once. You provide more value by engaging deeply with one or two projects than shallowly with many.

https://dsacms.github.io/ospo-guide/outbound/gen-ai-policy/#responsible-development-and-code-quality

Guideline: Human Review and Validation

Using AI should not result in a net loss of increasingly limited time and effort for human reviews.

- **Unacceptable**: Submitting a PR where the effort you put in, such as writing a prompt, is less than the effort it would take a maintainer to review it. We can already write prompts or run automated tools ourselves and doing that directly is faster and more secure than reviewing a low effort PR.

Please refer to Reducing the Risk of Extractive Contributions section for additional guidance.

Pull Request Guidelines: Accept, Non-accept, Disclosure

We don’t accept PRs that:

- Don’t directly address an existing issue
- Touch more than X files at a time
- Contain more than Y commits
- Change core system files such as …
- Are untested / don’t pass our test suite / don’t pass our linters / don’t follow style guide

Please provide an explanation on how AI was used in the development of this pull request.

- ❑ Type of assistance:
  - ❑ Code generation
  - ❑ Documentation
  - ❑ Debugging
  - ❑ Testing
  - ❑ Refactoring
  - ❑ Other:
- ❑ Scope of usage: *Which files, functions, or sections were AI-assisted*
- ❑ AI System used:
  - ❑ ChatGPT
  - ❑ Claude
  - ❑ Gemini
  - ❑ GitHub Copilot
- ❑ Level of modification:
  - ❑ As-is
  - ❑ Modified
  - ❑ Used as inspiration
- ❑ Prompts used: *Please list or explain prompts that were used to develop this contribution*

Repository Governance Improves Quality and Reduces Risk

These guidelines were built to improve contributions ***from humans first***, but also happen limit extractive AI contributions as a side-effect.

- Limiting PRs/contributions to existing tickets reduces the risk of '**roadmap drift**', where contributions redirect limited time/energy/attention from the established priorities of the project.
- Limiting edits, commits, and file surface reduces the 'splash radius' and review time needed from a human.
- Test suites, linters, and style guides ensure that contributions meet our standards, do not introduce breaking changes, and maintain a consistent voice/brand/culture.
